

**IDM**  
**Business Rules**

*Nicholas Nisbet*

# IDM Technical Architecture

**Focus on Business Rules and Verification Tests**

# Tests

Tests can be checked  
Tests can be automated

## Verification tests

- build on the validation of the building model
- validate against purpose of exchange

## Business rules

- project standards and processes
- enterprise standards and processes
- national standards and processes

# Tests and non-Tests

What's the difference ?

Test

***Testable***

- '... is an approved vapour barrier'
- '... has a permeability of less than 1 perm'

Non-Test

***Not Testable***

- '... is weather-proof'
- '... is a vapour barrier'

# Boolean and Logical Tests

Contractual Specifications  
must be testable

## Boolean test

***Known***

- yes, true, pass
- no, false, fail

## Logical test

***Knowable***

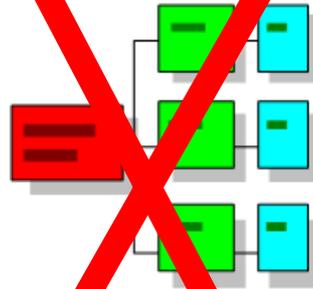

- yes, true, pass
- unsure, unknown, indeterminate
- no, false, fail

# Users

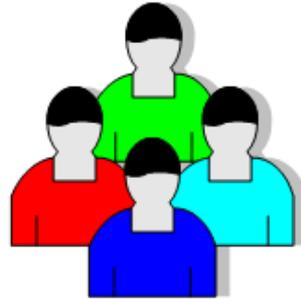

Tests serve a purpose

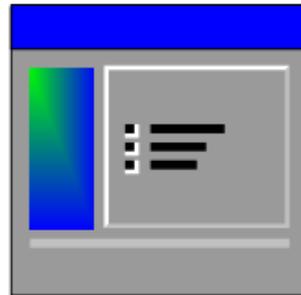

Executive User

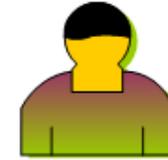

- aware of process and business impacts
- doesn't need technical detail about use of information in the process
- does not need to know about software or format

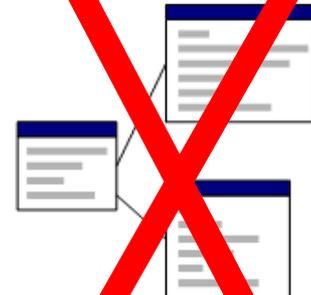

End Users

- needs to know what information to expect and how to use it in the business process
- does not need to know about software or format

Solution Provider

dSA

- writes software + data exchange interface
- needs to know what users expect from software
- needs to know about the exchange format

# Tests

## Types of test

- objects (including relationships) present or absent
- values present or absent from range or lists

## Examples

- internal spaces present but no external spaces
- naming of spaces to BS 4157 conventions
- layering to BS1192:2007
- take-off classified to RICS BCIS
- materials named as on enterprise approved lists

Compliance tier	Topics covered	Example failure	Detection
Validity	Domain expertise Application requirements	Escape from room with no door.	Domain application rules, results.
<b>IDM</b>	<b>Project process based requirements, Expectations, Fitness for purpose.</b>	<b>Absence of connections on HVAC</b>	<b>?</b>
IFC endorsed property set usage (ie IFC2x4, IFD).	Naming, value types	Incorrect spelling of 'PsetSpace_Common'	Inspection
IFC view definition: Coordination or Code-Checking.	Anticipated entities. Implementation Agreements.	Absence of space boundaries	IAI Certification
IFC schema rules	Cardinality and 'where' rules	Empty list in material relationship	Toolkit validation
IFC schema content	Entities and properties	Incorrect number or type of attributes	Toolkit read/write
ISO-10303 STEP SPF:Part21 or XML:Part28	File layout and syntax	Incomplete comment delimiters	General read/write code

# Technical Concept

Which of these five are Tests?

Description of information required and specification of values to be set

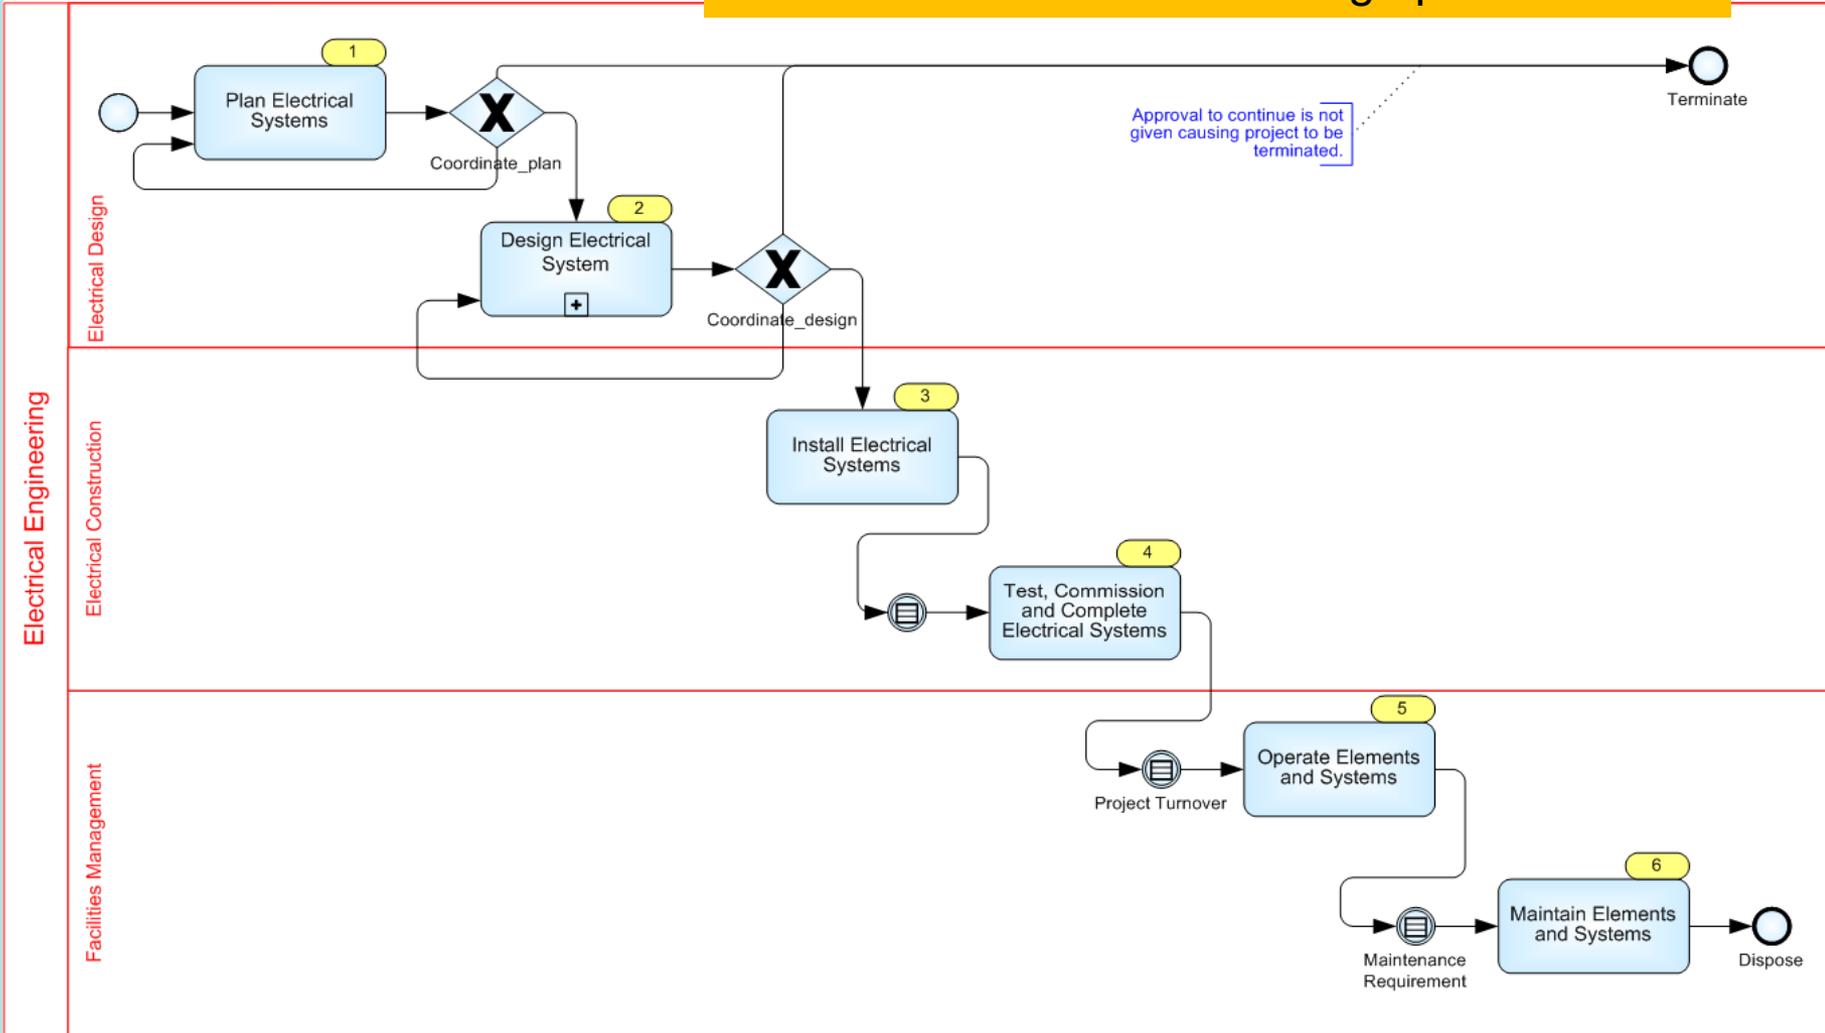

Name of entity/attribute or property set/property to be used

Mandatory (actual/recommended) or Optional to use

Description	Entity/Pset/Functional Part	M A N	R E C	O P T
Specify the system occurrence in which elements will participate  <i>A system opening is directly specified as an occurrence.</i>	IfcSystem OR IfcElectricalCircuit  <b>Testable</b>	✓		
Set the global unique identifier	IfcSystem.GlobalId → IfcGloballyUniqueId OR IfcElectricalCircuit.GlobalId → IfcGloballyUniqueId  <b>Testable</b>	✓		
Assert the owner history of the system	IfcSystem.OwnerHistory → fp_apply_owner_history OR IfcElectricalCircuit.OwnerHistory → fp_apply_owner_history  <b>Testable</b>	✓		
Specify the name of the system.  <i>Although this is an optional attribute within IFC, it must be asserted for system.</i>	IfcSystem.Name → IfcLabel OR IfcElectricalCircuit.Name → IfcLabel  <b>Not Testable</b>		✓	
Specify a description for the system  <i>Whilst the description does not add value to the semantics of the system, it can provide significant information for later project stages.</i>	IfcSystem.Description → IfcText OR IfcElectricalCircuit.Description → IfcText  <b>Not Testable</b>			✓

# Example

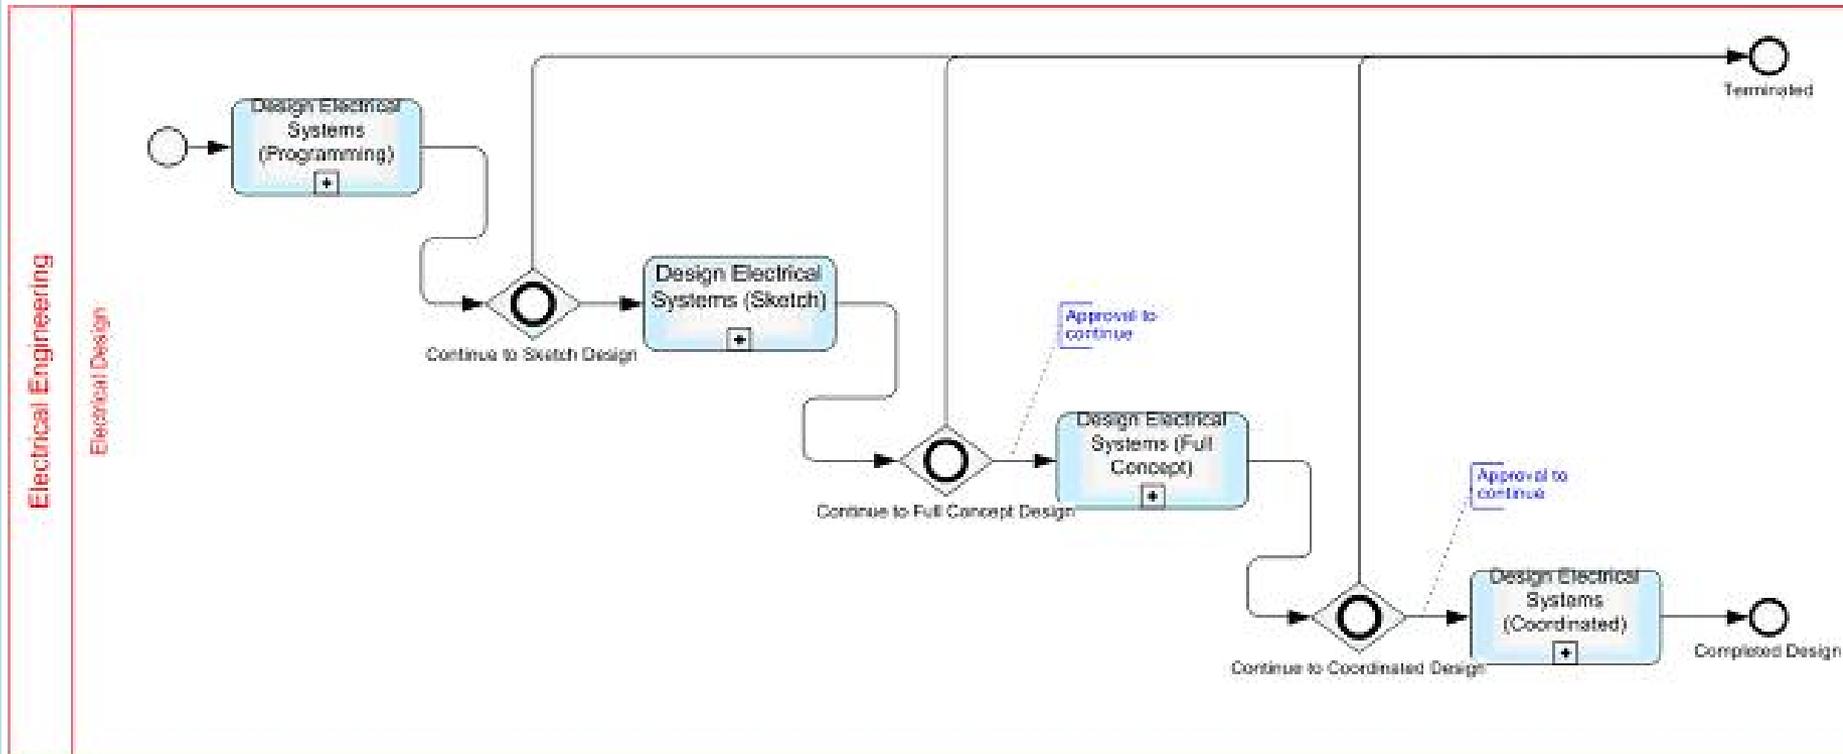

This example is from the HITOS project and focuses on the Electrical design process.

Electrical Engineering	author: Jeffrey Wix	created: 20/12/2005 15:24:35	
Electrical Engineering	version: 0.3	modified: 05/03/2006 14:31:29	
Top level diagram for electrical project electrical engineering	status: created	bpmn_electrical_engineering.vsd	

# Process: electrical design

- Pre-requisites for electrical design
- Criteria for completion of electrical design

# Specific process details

This process includes determining:

- Estimate of load to determine incoming size
- Identify main vertical routes using indicated spaces
- Location, sizing and identification of technical spaces
- Costing for presentation is by high level aggregation element such as lighting overall (1 less digit in classification table!).
- Specification of types of system and principles of operation.
- Sketch design [BIM] showing technical spaces, vertical distribution routes, key horizontal routes using cable carriers to describe principal routing

Specifics for Norwegian Practice

- NS3451, Building element level of systems (down to level of whole system such as all lighting)
- Costing uses NS3453 (standard table for building categories) likely to be based on sq.m. prices against known previous example buildings.

# Sample tests

Usually applicable to all schema versions  
Frequently tighten IFC schema constraints

- { 1 <= self.BasePhase <= 3 }
- Exists(self.Name)
- self.BaseVoltage in [110,250,260]
- self.BaseFrequency >= 50
- PropertyExists('Graphical','LayerName')

# Extending the FP with Clauses

Description	Entity	Name and Test Clause
<p>Model the correct number of ports for the element to which the ports are assigned: for example:</p> <p><b>flow terminals terminate a distribution system.</b></p>	<p><i>a subtype of (Ifc) Distribution Element</i></p> <p><b>Ifc Flow Terminal</b></p>	<p><b>flow_terminals_should_have_one_port</b></p> <p><b>sizeof (self.hasPorts) = 1</b></p>

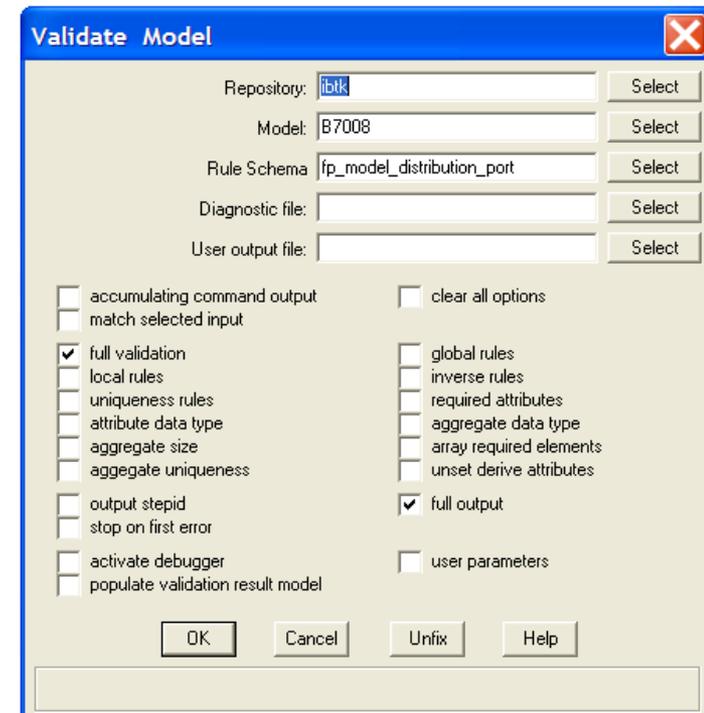

```
#75= idmLOGICALTEST(
    '1234567890123456789075',
    'br_flow_terminals_should_have_one_port',
    'flow terminals terminate a distribution system.', $,
    '2005-10-03','2005-11-09',$,.F.,(#50,#51),
    'IfcFlowTerminal',
    'sizeof(self.hasPorts)=1'
);
```

IDM for Tromsø College Exchange Duct

Name: Exchange Duct

Description: This exchange requirement describes the information to be provided about ductwork systems. It allows for the provision of information at various stages during the design process including:  
 " Line based representations at early design stages that enable routing, terminal location and main plant location information to be exchanged;  
 " Full 3D shape representations at detailed design stages that enable coordination between different building services systems, between services and structure and between services and the building construction elements.  
 This exchange requirement describes the information to be provided about ductwork systems. It allows for the provision of information at various stages during the design process including:

Identifier: er\_exchange\_duct
